

Sustainable Deployment of the LifeStraw Family

LOCATION

Kenya

DEVELOPED BY

Lifestraw

TYPE

WATER TREATMENT

SDG GOALS

PROJECT DESCRIPTION

CO2 AVOIDED/year

2 073 328
tCO2e

"The LifeStraw® Family units treat contaminated drinking water via a special microbiological filter. This reduces the demand for conventional water treatment, which is achieved through boiling water with non-renewable fuels. With the assistance of carbon finance, this project becomes economically sustainable and, moreover, provides a significant improvement in public health.

Social benefits include access to clean drinking water, reduced child and adult mortality, reduced costs to families and increased attendance at schools."

This is a **Gold Standard** project
